

CLI Testing and Troubleshooting

Doug Southworth • Indiana University • <u>dojosout@iu.edu</u>

perfSONAR is developed by a partnership of

• Commands and Syntax

pscheduler – The Secret Sauce

- pscheduler is the engine that drives perfSONAR
 - Coordinates timeslots and schedules tests between nodes
 - Creates a common syntax that all tools use
 - Handles the storage of results
- This approach to test management ensures that:
 - Tests that could impact each other's performance, like throughput, are never run simultaneously
 - Simplified coordination, where you don't need an engineer at the other end to start a daemon, open a port, etc.
 - Access control is maintained and test limits are enforced

Basic syntax

pscheduler task [options] test-type [test-options]

- task is what you want pscheduler to do
- *test-type* is how you want pscheduler to do it

There's more than one tool to run many of these tests, and pscheduler gives you the option to choose that tool:

- *iperf2/iperf3/nuttcp* for bandwidth
- *traceroute/tracepath/paris-traceroute* for routing
- --help is your friend!

Remote Commands, AKA, Your Best Friends

- --source and --dest flags do what you expect they would, but neither end has to be your node
 - You can run most tests between two remote nodes
 - This includes perfSONAR's built-in self-diagnostic tools
- This core piece of functionality is what makes perfSONAR useful in day-to-day troubleshooting activities and makes it more than just a simple performance data collector

[ps-iniu@thrpt10ge-1 ~]\$ pscheduler task throughput --source perf.newy32aoa.neaar.net --dest test.seat.transpac.org
Submitting task...

Wait, did you say built-in diagnostics??

- pscheduler troubleshoot
 - See if your node has the basic, necessary services running, if PMTUD is working, if the clock is synched to an NTP source, etc.
- pscheduler troubleshoot \$remote_node1
 - Same as above, but adds in the same tests on a remote node to ensure your two nodes can successfully complete a test
- pscheduler troubleshoot --host=\$remote_node1 \$remote_node2
 - Same as the first two, but checking two remote nodes against each other

[ps-iniu@thrpt10ge-1 ~]\$ pscheduler troubleshoot --host perf.newy32aoa.neaar.net test.seat.transpac.org
Performing basic troubleshooting of perf.newy32aoa.neaar.net and test.seat.transpac.org.

perf.newy32aoa.neaar.net:

Measuring MTU... 9000+ Looking for pScheduler... OK. Fetching API level... 4 Checking clock... OK. Exercising API... Status... Tests... Tools... OK. Fetching service status... OK. Checking services... ticker... scheduler... runner... archiver... OK. Idle test.... 4 seconds.... Checking archiving... OK.

test.seat.transpac.org:

Measuring MTU... 9000+ Looking for pScheduler... OK. Fetching API level... 4 Checking clock... OK. Exercising API... Status... Tests... Tools... OK. Fetching service status... OK. Checking services... ticker... scheduler... runner... archiver... OK. Idle test.... 4 seconds.... Checking archiving... OK.

perf.newy32aoa.neaar.net and test.seat.transpac.org:

Checking IP addresses... IPv4 Measuring MTU... 9000+ Checking timekeeping... OK. Simple stream test.... 11 seconds.... OK.

pScheduler on both hosts appears to be functioning normally.

perfS NAR

Yeah, but what about pscheduler monitor?

Yep, that works too.

pscheduler monitor --host=\$remote_host

You can even plot a host's schedule:

pscheduler plot-schedule --host=\$remote_host

Examples from real world scenarios

NRAO/UVA <> SARAO Performance Problem

- Data sharing from the National Radio Astronomy Observatory, located on the University of Virginia campus, to the South African Radio Astronomy Observatory
 - Low performance 4.8Mbps
- Initial testing from the South African side revealed a few potential problems, such as asymmetric routing and paths with unnecessarily circuitous routes.
 - These were identified using normal traceroutes and quickly corrected
 - No appreciable change in performance

Identification of possible pS toolkits

Initial problem isolation

 Tests from various domestic and international perfSONAR nodes to UVAs campus were telling:

- CHPC South Africa -> Internet2 Washington 6.67 Gbps
- Internet2 Albany -> Internet2 Washington 9.893 Gbps
- Internet2 Washington -> NRAO 3.31 Gbps (lots of retries)
- Internet2 Washington -> HPC University Virginia 2.21 Gbps (lots of retries)
- NRAO -> HPC University Virginia 6.64 Gbps (lots of retries)

Path MTU Discovery (PMTUD)

- Is a layer 3 construct
- Requires UDP and ICMP to function
 - UDP packets larger than the MTU setting of the receiving router interface will trigger an ICMP "unreachable" message back to the sending router, which in turn causes a renegotiation to a lower MTU
- All is not lost if PMTUD doesn't work
 - Smart transfer tools can figure out a common MTU, at the cost of time
 - Packets sent at 9K can be fragmented to adhere to a smaller MTU, at the cost of performance...unless the no-fragment flag is set
 - Neither of these scenarios is good for high performance. PMTUD should be made to work and common MTUs enforced wherever possible

Further isolation

Working inward from a known good ESnet perfSONAR node to UVA:

Interval	Throughput	Retrans	smits Current Window	/
0.0 - 1.0	9.13 Gbps	22	33.17 MBytes	
1.0 - 2.0	9.35 Gbps	0	33.58 MBytes	
2.0 - 3.0	9.38 Gbps	0	33.58 MBytes	
3.0 - 4.0	9.38 Gbps	0	33.58 MBytes	
4.0 - 5.0	9.38 Gbps	0	33.58 MBytes	
5.0 - 6.0	9.35 Gbps	0	33.58 MBytes	
6.0 - 7.0	9.36 Gbps	0	33.58 MBytes	
7.0 - 8.0	9.38 Gbps	0	33.58 MBytes	
8.0 - 9.0	9.37 Gbps	0	33.58 MBytes	
9.0 - 10.0	9.37 Gbps	0	33.58 MBytes	

This test looks good, because the hosts successfully negotiate 1500 MTU

Well, that looks good. Let's try tracepath and see where the MTU changes

Tracepath: ESnet to NRAO

Traceroute works, but tracepath doesn't??

Different Tools, Different Packets

- Traceroute uses small 60B UDP packets
- Tracepath uses larger 64KB UDP packets

So, somewhere we have a roadblock. Small packets can make it through, but larger ones are dropped (not fragmented).

How do we figure out the max size? Trial and error. Start at 9K and cut the size in half until you get a response, then sneak back up until the packets disappear again.

ESnet

Problem located

- The issue was between the MARIA router and the UVA router
 - The MARIA interface was configured for MTU 9192
 - The UVA interface was configured for MTU 1518
- With PMTUD broken there was no hope for external MTU 9000 equipment to negotiate an appropriate MTU with the NRAO node
- UVA changed the MTU on their router interface to match that of MARIA, while keeping their downstream equipment at their campus standard MTU 1500

Ping verification

ping -s 8972 -M do -c 4 perfsonar-10.cv.nrao.edu (don't fragment)

PING perfsonar-10.cv.nrao.edu (198.51.208.55) 8972(9000) bytes of data. PING perfsonar-10.cv.nrao.edu (198.51.208.55) 8972(9000) bytes of data. 8980 bytes from perfsonar-10.cv.nrao.edu (198.51.208.55): icmp_seq=1 ttl=55 time=10.3 ms 8980 bytes from perfsonar-10.cv.nrao.edu (198.51.208.55): icmp_seq=2 ttl=55 time=10.2 ms 8980 bytes from perfsonar-10.cv.nrao.edu (198.51.208.55): icmp_seq=3 ttl=55 time=10.2 ms 8980 bytes from perfsonar-10.cv.nrao.edu (198.51.208.55): icmp_seq=4 ttl=55 time=10.2 ms

Yeah, yeah, but what about performance??

Before:

pscheduler task throughput --source cpt-chpc-10g.perfsonar.ac.za --dest perfsonar-10.cv.nrao.edu

Summary

Interval Throughput Retransmits Receiver Throughput 0.0 - 10.0 380.37 Kbps 58 108.18 Kbps

After:

pscheduler task throughput -t 30 --source cpt-chpc-10g.perfsonar.ac.za --dest perfsonar-10.cv.nrao.edu

SummaryIntervalThroughputRetransmitsReceiver Throughput0.0 - 30.02.67 Gbps02.62 Gbps

You think we need one more? You think we need one more.

Alright. We'll do one more.

CCNY

City College of New York (CCNY) to Kyutech Institute (JGN)

Reported asymmetric, poor performance across GRE tunnel

- JGN \rightarrow CCNY (TCP)
 - No packet loss
 - 79Mbps throughput
- CCNY \rightarrow JGN (TCP)
 - 0.082% packet loss
 - 8Mbps throughput

Tested UDP performance, however, was symmetric at 90Mbps either direction

Kyutech

Institute

Initial troubleshooting

Used perfSONAR nodes along the path to test to closest open node available-at ManLan.

Nodes located at •APAN/Tokyo •TransPAC/Seattle •Internet2/Chicago •NEAAR/ManLan

Testing to NYC showed good performance and no packet loss- indicating problem was likely within CCNY

Internal troubleshooting

- CCNY and EPOC engineers installed perfSONAR node in researcher's lab
- Tests from prior locations to lab showed same packet loss as original problem
- Verified issue within campus

©2022 The perfSONAR Project and its Contributors ESnet GÉANT

Regional troubleshooting

NYSERNet

- Regional network for NY
- Provides R&E connectivity for CCNY
- Engineers installed a new CCNY pS node at campus edge

Testing edge to lab

- Packet fragmentation and MTU issues on the ingress path to CCNY
- Packet loss isolated to specific segment of the CCNY campus network

nysernet

Problem located

With this data

- **CCNY** engineers did additional local troubleshooting
- Cause identified as outdated network security device
- **Replacement had been** scheduled, expedited due to results

After replacement

pS tests verified performance was greatly improved

Final Results

- CCNY/JGN GRE tunnel shows consistent, symmetric performance
 JGN → CCNY (TCP)
 - No packet loss
 - 80Mbps throughput

•CCNY \rightarrow JGN (TCP)

- No packet loss
- 85Mbps throughput
- 10-fold improvement
